

Why ProjectObjects? >>

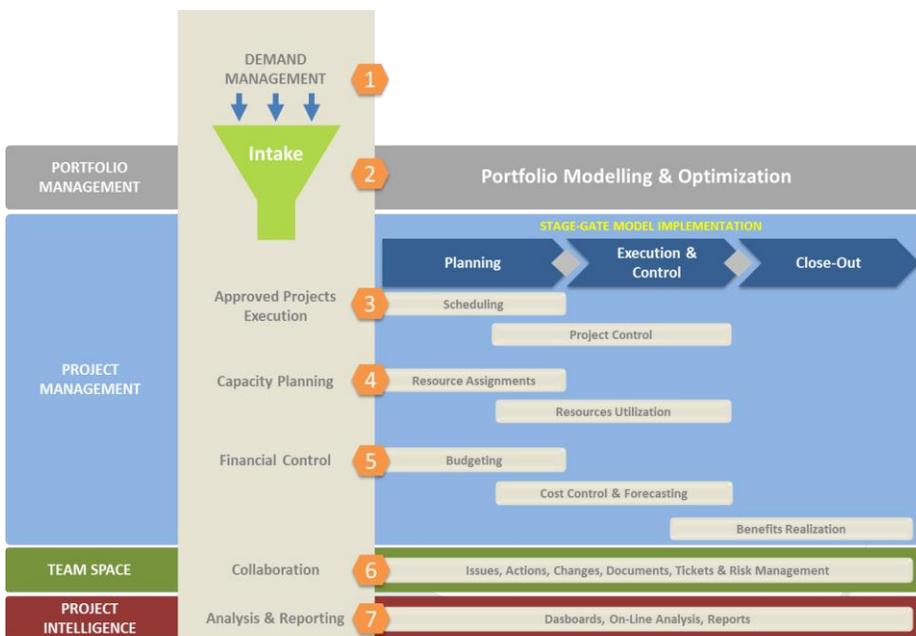

Delivering complex programs alongside multiple small projects on time and on budget is a major challenge for any organization.

ProjectObjects supports organizations facing these challenges by delivering a flexible Project and Portfolio Management (EPPM) solution through advanced Project Management techniques for Cost Control & Forecasting and Earned Value Management.

ProjectObjects' robust and flexible framework drives PPM solutions that address the needs of any organization, regardless of size or industry sector.

ProjectObjects modular architecture is the ideal partner in an Enterprise Project & Portfolio Management solution:

- Project Control processes are fully covered through advanced vertical modules, based on internationally adopted Project Management methodologies.
- Cross-solution modules are designed to support collaborative project management across teams and other organizational structures.

Project Objects Solutions

ProjectObjects doesn't have a standard product that we try to fit to every customer and we don't have a standard implementation model that every customer has to work with. Instead, we offer a flexible, scalable solution that can work with your needs and grow with you as your PPM needs mature.

Our implementations focus on ensuring that our product is delivering the benefits that you need, configuring the tool to meet your needs and never asking you to compromise the way that you want to run your business.

ProjectObjects works with your portfolio, program and project management resources, providing them with the tools and information that they need to be optimally effective in executing on your initiatives without requiring them to learn entire new ways of operating.

Our PPM Suite has been developed with the customer in mind, and here are just some of the ways that ProjectObjects stands apart.

ProjectObjects offers a single, comprehensive solution that can support the large scale, enterprise wide initiatives and the more straightforward department and team level projects.

The modular approach allows customers to use the tools that they need to support each initiative and come together to provide a portfolio wide Enterprise Project Intelligence (EPI) platform that provides reporting and analytics at any level of the portfolio – and it's all done within a single solution.

Who Uses ProjectObjects? >>

With its modular architecture, ProjectObjects can be configured to address the needs of all users, at various levels of the organizational structure, and in different stages of the Project and Portfolio Management (PPM) processes.

Team members, Project Controllers, Program & Project Managers, Department Managers, and Executives, can use specific ProjectObjects modules to support daily progress monitoring and also strategic business decision-making.

All project stakeholders can rely on dedicated modules, specifically designed for their role.

ProjectObjects can provide analytical tools and tailored information to each project team member, coherent with their role and permissions.

ProjectObjects provides a unique ‘multi-dimensional’ flexibility in terms of configurability and scalability, which makes our solution different from any other PPM software. This is a huge advantage for our customers, who can count on a rapid implementation of a solution that best suits their needs, and can be easily scaled to address new business requirements.

How ProjectObjects Works?

Managing Projects Life Cycle

With ProjectObjects, the project execution processes can be managed using a Stage & Gate approach that helps you to build a conceptual and operational roadmap for moving a new project from idea to launch.

The project development process can be organized into distinct, time-sequenced stages separated by management decision gates.

Each stage can be associated to a prescribed set of activities, deliverables and milestones that must be successfully completed before getting management approval to proceed to the next stage of project development.

Scheduling & Resource Planning

The project’s schedule can be created either using the ProjectObjects web interface or using the Microsoft Project desktop client.

Resources can be easily planned across project activities. Resource planning and control is delivered through a set of powerful functions that enable users to:

- Assign resources by skill or by name
- Substitute resources according to their skills
- Quickly locate alternative resources in case of overload assignments

Cost Management

ProjectObjects is capable of supporting cost management processes from budgeting to control & forecasting. Costs can be organized according to company Cost Breakdown Structure (CBS) and Accounting Codes in order to guarantee cross-project consolidation at company level.

The seamless integration with resource management, contracts & rates, timesheets and expenses tracking enable the full control of project costs & revenues, providing a clear picture of financial project’s health to executives and project managers.

Cost data is perfectly integrated with the project schedule. It can be organized according to multiple hierarchical codes, and also integrated with company ERP systems.

Project Collaboration

ProjectObjects Collaboration capabilities have been designed to enable projects teams to share information about Issues, Actions, Changes, Risks and Documents in a single repository. Project documents can be stored in the ProjectObjects repository and downloaded via Web when required.

Risk management can be performed in line with defined best practices that enable users to identify, analyse, manage, and control project risks.

Individual risks can be evaluated in order to determine their score and then aggregated at project level for overall risk score evaluation.

Response actions that mitigate or avoid these risks can be created and tracked through the fully integrated Action Tracking module.

Time & Expenses Tracking

ProjectObjects Timesheet & Expense Tracking capabilities bridge the gap between executive/project manager decision-making and day-by-day project execution.

With ProjectObjects, timesheet preparation and management is simple. Delivered entirely on the web through a user-friendly interface, employees and consultants can now get involved in company project tracking with the greatest of ease.

Release and approval processes are workflow-driven.

About Project Objects

ProjectObjects has a unique, customer-centric Value Proposition that creates and distributes value at all levels of a customer’s organization:

- Rapid Implementation
- High ROI
- Value for Money
- Low TCO
- One solution fits all roles

Our value proposition is delivered via our People, Products, Solutions, Partners and Services
